A call center administrator has devised a way to provide special treatment for high profile customers, by filtering these agent's Automatic Number Identification (ANI) using a vector routing table, and interflowing these calls to be queued at a higher priority. Unfortunately, after the new VDN/vector steps were implemented, those customers are queuing to the incorrect group of agents.

What would be the reason for this?

A. VDN Override on VDN 7202 is set to no

B. VDN Override on VDN 7201 is set to yes

C. The caller has blocked his calling party number, a match cannot be found, and call processing for this call will cease

D. No agents are staffed in skill 1

Answer: A

3.You need to troubleshoot your Best Service Routing (BSR) polling vectors to verify that they are

operating as intended.

Which command do you use to do this?

- A. monitor bcms hunt group
- B. list trace trunk
- C. monitor bcms trunk
- D. list trace vdn

Answer: D

4.To improve call handling and agent productivity you set up a vector using Look Ahead Interflow to check if the remote site can accept a call and has an agent available. You only want to interflow calls that are at the top two positions queue.

Which command would be entered in the vector to accomplish this?

- A. route-to number 9581234 with cov y if interflow-qpos=2
- B. route-to number 9581234 with cov n if interflow-qpos<=2
- C. route-to number 9581234 with cov n if interflow-qpos<2
- D. route-to number 9581234 with cov y if interflow-qpos>=2

Answer: D
